| 1     | PCI0/CR#_A     | I/O  | 3.3V PCI clock output or Clock Request control A for either SRC0 or SRC2 pair<br>The power-up default is PCI0 output, but this pin may also be used as a Clock Request control of SRC pair 0 or SRC pair 2 via SMBus. Before configuring this pin as a Clock Request Pin, the PCI output must first be disabled in byte 2, bit 0 of SMBus address space. After the PCI output is disabled (high-Z), the pin can then be set to serve as a Clock Request pin for either SRC pair 2 or pair 0 using the CR#_A_EN bit located in byte 5 of SMBus address space.<br>Byte 5, bit 7<br>0 = PCI0 enabled (default)<br>1 = CR#_A enabled. Byte 5, bit 6 controls whether CR#_A controls SRC0 or SRC2 pair<br>Byte 5, bit 6<br>0 = CR#_A controls SRC0 pair (default),<br>1 = CR#_A controls SRC2 pair |
| 2     | VDDPCI         | PWR  | Power supply pin for the PCI outputs, 3.3V nominal  |
| 3     | PCI1/CR#_B     | I/O  | 3.3V PCI clock output/Clock Request control B for either SRC1 or SRC4 pair<br>The power-up default is PCI1 output, but this pin may also be used as a Clock Request control of SRC pair 1 or SRC pair 4 via SMBus. Before configuring this pin as a Clock Request Pin, the PCI output must first be disabled in byte 2, bit 1 of SMBus address space. After the PCI output is disabled (high-Z), the pin can then be set to serve as a Clock Request pin for either SRC pair 1 or pair 4 using the CR#_B_EN bit located in byte 5 of SMBus address space.<br>Byte 5, bit 5<br>0 = PCI1 enabled (default)<br>1 = CR#_B enabled. | 4     | PCI2/TME       | I/O  | 3.3V PCI clock output / Trusted Mode Enable (TME) Latched Input. | 6     | PCI4/SRC5_EN   | I/O  | 3.3V PCI clock output / SRC5 pair or PCI_STOP#/CPU_STOP# enable strap. On powerup, the logic value on this pin determines if the SRC5 pair is enabled or if CPU_STOP#/PCI_STOP# is enabled (pins 37 and 38). The latched value controls the pin function on pins 37 and 38 as follows<br>0 = PCI_STOP#/CPU_STOP#<br>1 = SRC5/SRC5#  |
| 7     | PCI_F5/ITP_EN  | I/O  | Free running PCI clock output and ITP/SRC8 enable strap. This output is not affected by the state of the PCI_STOP# pin. On powerup, the state of this pin determines whether pins 38 and 39 are an ITP or SRC pair.<br>0 = SRC8/SRC8#<br>1 = ITP/ITP#   |

| 9     | VDD48          | PWR  | Power supply for USB clock, nominal 3.3V.   |
| 10    | USB_48MHz/FSLA | I/O  | Fixed 48MHz USB clock output. 3.3V / 3.3V tolerant input for CPU frequency selection. Refer to input electrical characteristics for Vil_FS and Vih_FS values.   |

<sup>1</sup>Measurement taken for single ended waveform on a component test board (not in system)

<sup>2</sup>Measurement taken from differential waveform on a component test board. (not in system)

<sup>3</sup>Slew rate emasured through V<sub>swing</sub> voltage range centered about differential zero

<sup>4</sup>V<sub>cross</sub> is defined at the voltage where Clock = Clock#, measured on a component test board (not in system)

<sup>5</sup>Only applies to the differential rising edge (Clock rising, Clock# falling)

<sup>6</sup>Total distributed intentional SRC to SRC skew.

<sup>7</sup>The max voltage including overshoot.

<sup>8</sup>The min voltage including undershoot.

<sup>9</sup>The total variation of all V<sub>cross</sub> measurements in any particular system. Note this is a subset of V<sub>cross</sub> min/mas (V<sub>Cross</sub> absolute) allowed. The intent is to limit V<sub>cross</sub> induced modulation by setting C<sub>cross\_delta</sub> to be smaller than V<sub>Cross</sub> absolute.

<sup>10</sup>Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

**NOTES on DIF Output Jitter: (unless otherwise noted, guaranteed by design and characterization, not 100% tested in production).**

<sup>1</sup>Jitter specs are specified as measured on a clock characterization board. System designers need to take special care not to use these numbers, as the in-system performance will be somewhat degraded. The receiver EMTS (chispet or CPU) will have the receiver jitter specs as measured in a real system.

<sup>2</sup>Phase jitter requirement: The SRC outputs will meet the reference clock jitter requirements from the PCI Express Gen1 Base Spec. The test is performed on a component test board under quiet conditions with all outputs on. Jitter analysis is performed using the standardized tool provided by the PCI SIG.

NOTES on SE outputs: (unless otherwise noted, guaranteed by design and characterization, not 100% tested in production).

<sup>1</sup>Edge rate in system is measured from 0.8V to 2.0V.

<sup>2</sup>Duty cycle, Period and Jitter are measured with respect to 1.5V

<sup>3</sup>The average period over any 1us period of time

<sup>4</sup>Using frequency counter with the measurement interval equal or greater than 0.15s, target frequencies are 14.318180 MHz, 33.333333MHz and 48.000000MHz
